Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              protein
```

```
-i. PTM: Contains a coverently attached chromophore, which is composed of modified amino acid residues. The chromophore is formed upon of modified amino acid residues. The chromophore is formed upon cyclization of the residues. Ser-debydrocyry-GP.

-i. PIOTECHNOLOGY: Has become a useful and ubiquitous tool for making chimeric proteins of GFP linked to other proteins where it functions as a fluorescent protein tag. GFP tolerates N-and C-terminal fusion to a broad variety of proteins. It has been expressed in bacteria, yeast, slime mold, plants, Drosophila, zebrafish, and in mammalian cells. As a noninvasive fluorescent marker in living cells, it allows for a wide range of applications where it may function as a mesaure of protein-protein interactions.

"Structural and spectral response of green fluorescent protein
Biochemistry 38:5296-5301 (1939).
-!- FUNCTION: Energy-transfer acceptor. Its role is to transduce the bluorescent light by energy transfer. Fluorescess in vivo upon receiving energy from the Ca(2+)-activated photoprotein aequorin. Absorbs light maximally at 395 nm and exhibits a smaller absorbance peak at 470 nm. The fluorescence emission spectrum peaks at 509 nm with a shoulder at 540 nm.

-! FUNCTION: TRIFUNCTIONAL BNZYME BEARING THE GLM AMIDOTRANSFERASE (GATASE) DOMAIN OF ANTHRANILATE SYNTHASE, INDOLE-GLYCEROLPHOSPHATE SYNTHASE, AND PHOSPHOREDSYLANTHRANILATE ISOMERASE ACTIVITIES.

-!- CATALYTIC ACTIVITY: N- (5-phospho-beta-D-ribosyl) -anthranilate = 1-(2-carboxyphenylamino)-1-deoxy-D-ribulose 5-phosphate.

-!- CATALYTIC ACTIVITY: 1- (2-carboxyphenylamino)-1-deoxy-D-ribulose 5-phosphate = 1-(indo)-3-Yl)glycerol 3-phosphate + CO(2) + H(2)O.

-!- CATALYTIC ACTIVITY: Chorismate + L-glutamine = anthranilate +
                                                                                             01-NOV-1988 (Rel. 09, Last sequence update)
28-FEB-2003 (Rel. 41, Last annotation update)
Anthranilate synthase component II (EC 4.1.3.27) [Includes: Glutamine amidotransferase; Indole-3-glycerol phosphate synthase (EC 4.1.1.48) (IGPS); N-(5'-phosphoribosyl)anthranilate isomerase (EC 5.3.1.24)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   MEDIINE=86137391; PubMed=2936650;

"Enamelin maps to human chromosome 4q21 within the autosomal dominant amelogenesis imperfecta locus.";

Bur. J. Oral Sci. 108:353-358(2000).

-!- FUNCTION: Involved in the mineralization and structural organization of enamel. Involved in the extension of enamel during the secretory stage of dental enamel formation.

-!- SUBCELLULAR LOCATION: Secreted, extracellular matrix.

-!- TISSUE SPECIFICITY: Expressed in tooth particularly in odontoblast, ameloblast and cementoblast.

Proc. Natl. Acad. Sci. U.S.A. 97:8612-8616 (2000).

"In layering of neurons in the cerebral cortex and cerebellum.

Regulates microtubule function in neurons and neuronal migration.

Affects migration of sympathetic preganglionic neurons in the spinal cord, where it seems to act as a barrier to neuronal migration. Enzymatic activity is important for the modulation of call adhesion. Binding to the extracellular domains of lipoprotein receptors VLDIR and ApoER2 induces tyrosine phosphorylation of Dabl and modulation of Tau phosphorylation.

-!- CATALNTIC ACTIVITY: ATP + L-alanine + LENA(Ala) = AMP +
diphosphate + L-alanyl-LENA(Ala).
-!- SUBCELLULAR LOCATION: Cytoplasmic.
-!- SUBCELLULAR LOCATION: Cytoplasmic.
-!- SIMILARITY: Belongs to class-II aminoacyl-tRNA synthetase family.
                                                                                                                                                                                                                                                                                                             Gaps

                                                                                                                                                                                                                                                                                                                                                                       -i- FUNCTION: Essential for photosystem II (PSII) biogenesis; putative protein stability or assembly factor for PSII.
-i-SUBCELDULAR LOCATION: Chloroplast; within the thylakoid lumen but attached to the membrane. Restricted to the stromal lamelae.
-i- TISSUE SPECIFICITY: Expression in green tissue, not roots.
-i- DEVELOPMENTAL STAGE: Accumulates also in dark-grown seedlings.
-i- SIMILARITY: Belongs to the yef48 family.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           144 NYRFNSISFKGKEGWIIGKPAILLYTADAGE---NWDRIPLSSQLPGDMVFIKATEDKSA

                                                                                                                                                                Biochemistry 35:8110-8119(1996).

-!- FUNCTION: This polymerase possesses two enzymatic activities: DNA synthesis (polymerase) and an exonucleolytic activity that synthesis single stranded DNA in the 3' to 5' direction.

-!- CAȚALYȚIC ACTIVITY: N deoxynucleoside triphosphate = N diphosphate
                                                                                     X-RAY CRYSTALLOGRAPHY (2.2 ANGSTROMS) OF 1-388.

"Empirical analysis of transcriptional activity in the Arabidopsis
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Science 302:842-846(2003).

-!- FUNCTION: PLANT LIPOXYGENASE MAY BE INVOLVED IN A NUMBER OF DIVERSE ASPECTS OF PLANT PHYSIOLOGY INCLUDING GROWTH AND DIVERSE ASPECTS OF PLANT PHYSIOLOGY INCLUDING GROWTH AND DEVELOPMENT, PEST RESIZTANCE, AND SENESCENCE OR RESPONSES TO WOUNDING. IT CATALYZES THE HYDROPEROXIDATION OF LIPIDS, CONTAINING A CIS, CIS-1,4-PENYADIENE STRUCTURE.

-!- CATALYTIC ACTIVITY: Linoleate + O(2) = (9Z,11E)-(13S)-13-hydroperoxyoctadeca-9,11-diaenoate.

-!- COFACTOR: Iron, one atom tightly bound per molecule (By
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               similarity).
SUBCELUIAR LOCATION: Chloroplast (Potential).
TISSUB SPECIFICITY: In leaves and inflorescences but not abundant in seeds, roots and stems.
INDUCTION: By methyl jasmonate and wounding.
SIMILARITY: Belongs to the lipoxygenase family.
SIMILARITY: Contains 1 PLAT domain.
CAUTION: Ref. 2 sequence differs from that shown due to erroneous gene model prediction.

TISSUB SPRCIFICITY: Abundantly produced during brain ontogenesis by the Cajal-Retzius cells and other pioneer neurons located in the telencephalic marginal zone and by granule cells of the external granular layer of the cerebellum.

DOMAIN: The basic C-terminal region is essential for secretion (By
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      characterized by tremor, gait attaxia, cerebellar hypoplasia and abnormal neuronal migration (particularly in the cerebral cortex and hippocampus). The mutation is due to a nucleotide insertion at codon 1892 which results in a translational frameshift and truncation of the protein.

SIMILARITY: Contains 8 EgF-like domains.

SIMILARITY: Contains 15 BNR repeats.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     EMBL; AB049473; BAD78470.1; -

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                          US-09-890-463-4

APPLICANT FORDS. Krista

TITLE OF INVENTION: Mutants of Green Fluorescent Protein
FILE REFERENCE: 0942, 4020002

CURRENT APPLICATION NUMBER: US 09/970, 762

PRIOR APPLICATION NUMBER: US 09/970, 762

PRIOR FILING DATE: 1999-11-14

PROR APPLICATION NUMBER: US 60/030,935

PRIOR FILING DATE: 1996-11-15

SOFTWARE: Patentin Ver. 2.0

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

A new Vibrio fischeri lux gene precedes a bidirectional termination site for the lux operon.";

Bacteriol. 172.197-6802(1990).

-!- FUNCTION: ACYL-PROTEIN SYNTHETASE ACTIVATES TETRADECANOIC ACID.

IT IS A COMPONENT OF THE FATTY ACID REDUCTASE COMPLEX RESPONSIBLE FOR CONVERTING TETRADECANOIC ACID TO THE ALDEHYDE WHICH SERVES AS STBSTRATE IN THE LUCIFERASE-CATALYZED REACTION.

-!- CATALYTIC ACTIVITY: ATP + an acid + protein = AMP + diphosphate + an acyl-protein thiolescer.

-!- PATHWAY: Bioluminescent fatty acid reduction system; second step.
                                                                                                                                                                                                                                                                                                   01-MAR-1992 (Rel. 21, Created)

"The expansion behaviour of sea anemones may be coordinated by two
inhibitory neuropeptides, Antho-KAamide and Antho-Riamide.";
Proc. R. Soc. Lond., B. Biol. Sol. 253:18811993).
-!- FUNCTION: Inhibits spontaneous contractions in several muscle
groups. May be involved in the expansion phase of feeding
behaviour in sea anemones.
-!- SUBCELLULAR LOCATION: Secreted.
-!- TISSUE SPECIFICITY: Neuron specific.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Nishioka K., Constantopoulos A., Satoh P.S., Najjar V.A.; The characteristics, isolation and synthesis of the phagocytosis stimulating peptide tuffsin."; Biochem.                 peptides from Bothrops insularis snake venom.",
J. Protein Chem. 9:221-227 (1990).
-1- FUNCTION: This peptide both inhibits the activity of the angiotensin-converting enzyme and enhances the action of bradykinin by inhibiting the kinases that inactivate it. It acts as an indirect hypotensive agent.
